**ADDRESS TO:** Assistant Commissioner for Patents  
 Box Patent Application  
 Washington, D. C. 20231

**APPLICATION ELEMENTS**

See MPEP chapter 600 concerning utility patent application contents.

1. X Fee Transmittal Form  
(Submit an original, and a duplicate for fee processing)
2. X Specification (Total Pages 17)  
(preferred arrangement set forth below)
  - Descriptive Title of the Invention
  - Cross References to Related Applications
  - Statement Regarding Fed sponsored R & D
  - Reference to Microfiche Appendix
  - Background of the Invention
  - Brief Summary of the Invention
  - Brief Description of the Drawings (if filed)
  - Detailed Description
  - Claims
  - Abstract of the Disclosure
3. X Drawings(s) (35 USC 113) (Total Sheets 4)
4. X Oath or Declaration (Total Pages 6)(Unsigned)
  - a.      Newly Executed (Original or Copy)
  - b.      Copy from a Prior Application (37 CFR 1.63(d))  
(for Continuation/Divisional with Box 17 completed) (**Note Box 5 below**)
  - i.      DELETIONS OF INVENTOR(S) Signed statement attached deleting inventor(s) named in the prior application, see 37 CFR 1.63(d)(2) and 1.33(b).
5.      Incorporation By Reference (useable if Box 4b is checked)  
The entire disclosure of the prior application, from which a copy of the oath or declaration is supplied under Box 4b, is considered as being part of the disclosure of the accompanying application and is hereby incorporated by reference therein.
6.      Microfiche Computer Program (Appendix)

7. ☐ Nucleotide and/or Amino Acid Sequence Submission  
(if applicable, all necessary)  
a. ☐ Computer Readable Copy  
b. ☐ Paper Copy (identical to computer copy)  
c. ☐ Statement verifying identity of above copies

**ACCOMPANYING APPLICATION PARTS**

8. ☐ Assignment Papers (cover sheet & documents(s))  
9. ☐ a. 37 CFR 3.73(b) Statement (where there is an assignee)  
☐ b. Power of Attorney  
10. ☐ English Translation Document (if applicable)  
11. ☐ a. Information Disclosure Statement (IDS)/PTO-1449  
☐ b. Copies of IDS Citations  
12. ☐ Preliminary Amendment  
13. ☒ Return Receipt Postcard (MPEP 503) (Should be specifically itemized)  
14. ☐ a. Small Entity Statement(s)  
☐ b. Statement filed in prior application, Status still proper and desired  
15. ☐ Certified Copy of Priority Document(s) (if foreign priority is claimed)  
16. ☒ Other: Express Certificate of Mailing  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

17. **If a CONTINUING APPLICATION**, check appropriate box and supply the requisite information:  
☐ Continuation ☐ Divisional ☐ Continuation-in-part (CIP)  
of prior application No: \_\_\_\_\_

**18. Correspondence Address**

\_\_\_\_ Customer Number or Bar Code Label \_\_\_\_\_  
(Insert Customer No. or Attach Bar Code Label here)  
or

# SYSTEM AND METHOD FOR CONNECTING A POWER CONVERTER TO A L AND GRID ARRAY SOCKET

## FIELD OF THE INVENTION

The present invention relates generally to power delivery for electronic circuits  
5 and, more particularly, to an improved power connector for land grid array (LGA) central  
processing unit (CPU) sockets.

## BACKGROUND

A standard computer system typically includes integrated circuit devices mounted  
to a large printed circuit board known as a motherboard using a socket or similar type of  
10 electrical connector. The motherboard is supplied with voltage from a power supply,  
usually at a higher DC level than is required by the integrated circuit device.

Currently, a voltage regulator (i.e., a DC-DC converter) is used in certain high  
performance computer systems along with a pin grid array (PGA) socket. The central  
processing unit (CPU) package that connects to the socket consists of an integrated  
15 circuit device (e.g., a silicon chip) soldered to a package substrate using flipchip ball grid  
array (FCBGA) which, in turn, is soldered to one side of an interposer using ball grid  
array (BGA) technology. The package substrate connects to the PGA socket using  
multiple contacts in a matrix arrangement each having a pin type tail. The DC-DC  
converter connection consists of a multi-layer flex board and an edge-card connector that  
20 connects to one edge of the interposer substrate. The present configuration requires the  
CPU package to be inserted into the PGA socket in the vertical axis (i.e., the Z-axis).  
The DC-DC converter is then attached in the X-axis sliding direction requiring a complex  
retention mechanism.

In the recently developed land grid array (LGA) socket an array of pads, rather than pins, provide the requisite electrical connections between the integrated circuit device and the printed circuit board. LGA sockets are advantageous because they do not require soldering between the socket and the CPU package. Moreover, LGA sockets  
5 reduce the height of the socket/package/CPU solution (because they do not require the use of long pins) thereby resulting in shorter circuit paths and improved electrical performance. However, in order to connect the current DC-DC converter to an LGA socket, an interposer would be required to provide the edge-card interface required by the DC-DC converter. The interposer would add height, electrical path length, and parasitic  
10 inductance to the socket/package/CPU solution, thus negating the advantages of using the LGA socket.

Although multiple one ounce copper power planes may also be used to supply power from the DC-DC converter to the CPU socket through the motherboard, an excessive number of power and ground contacts would be needed and the additional  
15 power and ground planes make motherboard routing difficult. Delivering high DC currents through the motherboard to the LGA socket is an expensive solution and has additional technical challenges not associated with delivering current directly onto the LGA socket assembly.

Therefore, it would be advantageous to provide a low inductance and resistance  
20 interconnect that improves the current carrying capacity from the DC-DC converter to the LGA socket. It would also be helpful if the interconnect required only a single direction (vertical or Z-axis) of assembly which would save time and manufacturing costs.

## BRIEF DESCRIPTION OF THE DRAWINGS

The present invention is illustrated by way of example, and not limitation, in the figures of the accompanying drawings in which like reference numerals refer to similar elements and which:

5        **Figure 1A** is a top view of an unassembled LGA integrated circuit device package and a DC-DC converter according to one embodiment of the present invention.

**Figure 1B** is a top view of an assembled LGA integrated circuit device package and a DC-DC converter according to one embodiment of the present invention.

10        **Figure 2** is an exploded view of a cross section of the contact details of a DC-DC converter as it is being mounted to a power socket interface according to one embodiment of the present invention.

**Figure 3** is an exploded view of a cross-section of the contact details of an LGA socket mounted to a motherboard according to one embodiment of the present invention.

15        **Figure 4A** is a cross-sectional view of the spatial relationship of the component parts of an unassembled LGA integrated circuit device package and a DC-DC converter according to one embodiment of the present invention.

**Figure 4B** is a cross-sectional view of the spatial relationship of the component parts of an assembled LGA integrated circuit device package and a DC-DC converter according to one embodiment of the present invention.

## DETAILED DESCRIPTION

Throughout the following description specific details are set forth in order to provide a more thorough understanding of the invention. However, the invention may be practiced without these particulars. In other instances, well known elements have not  
5 been shown or described in detail to avoid unnecessarily obscuring the present invention. Accordingly, the specification and drawings are to be regarded in an illustrative rather than a restrictive sense.

Compression contact technology has been used in the computer industry for a number of years. Various forms of this technology have been developed, including  
10 polymer based contacts with electrically conductive metal particles or wires imbedded in the polymer and stamped metal contact springs. For example, there are commercially available sockets, connectors, and interconnect products using this technology. However, compression contact technology has never been employed to connect a voltage regulator (i.e., a DC-DC converter) to a land grid array (LGA) socket.

15 It would be helpful to use compression contacts (e.g., metal, conductive polymer, or others) to eliminate the edge-card connector typically used in this application, thus reducing the loop inductance and contact resistance of the connection. Furthermore, compression contacts would simplify the retention and mounting mechanism of the LGA socket by providing a means for contacting the LGA socket from a vertical rather than a  
20 horizontal direction as is required using conventional edge-card connectors.

The present embodiment provides a power connector consisting of a circuit board connected to one end of a DC-DC converter output circuit board. Since the connector must carry very high current levels from the DC-DC converter to the LGA socket and

return (ground), these connections on the circuit board consists of one or more layers each of wide and thick metal, such as four ounce or six ounce copper. The compression contacts may be attached at the other end of the board with sufficient numbers and cross-sectional area to carry the required electrical current. The board may be mated to the LGA socket with the appropriate contact pattern and the contacts may be compressed with a clamping or retention mechanism. The retention mechanism provides the clamping force as well as the compression stop so that the contacts will be compressed to a predetermined level, but will not continue to compress further. The LGA socket has the required metal conductor layers to carry the electrical current from the power contacts and to the CPU.

Referring now to Figure 1A, there is shown a top view of an unassembled LGA integrated circuit device package and a DC-DC converter 100 in accordance with an embodiment of the present invention. An integrated circuit device 110 (i.e., a silicon chip) may be mounted to an LGA package 120 in a manner well known in the art of microelectronic fabrication. The LGA package 120 comprises a substrate which may be fabricated of laminates such as FR-4, fiberglass or bismaleimide-triazine (BT) material, of coated aluminum, ceramic, or other suitable materials and multiple conductive layers which are laminated or co-fired between the varied dielectric layers. The integrated circuit device 110 may be an analog device, a microprocessor, an application specific device, or any other type of integrated circuit device and may be electrically connected to an array of terminals (i.e., typically circular or rectangular pads) (not shown in this view) on the LGA package 120. The pads on the LGA package 120 correspond to a pattern of

a contact array (not shown in this view) on an LGA socket 130 when properly aligned with the socket 130.

The socket itself 130 is sandwiched between the LGA package 120 and the motherboard (not shown in this view). The socket 130 comprises a substrate formed of non-conductive material to receive the LGA package 120. The contacts on the socket 130 may be fabricated of a conductive material and extend transversely through the substrate from a top surface of the substrate to a bottom surface of the substrate. The contacts function to electrically couple the socket 130 and the LGA package 120 to the underlying motherboard on which the socket 130 is mounted. The socket 130 may be mated to the motherboard by a force applied downwardly on the socket 130 which then compresses the conductive elements to effect a reliable electrical contact between the socket 130 and its respective contact pads and the motherboard and its respective contact pads. In order to maintain alignment between the pads, a retention mechanism such as a frame element (now shown in this view) may be provided around the socket 130. In addition, a spring clip extending across the body of the frame element or any other suitable clamping mechanism may be used to hold the socket 130 down against the pads on the motherboard. Of course, it should be noted that the socket 130 may also be soldered down (surface mounted) to the motherboard using conventional reflow soldering methods or mounted to the motherboard using a variety of other techniques well known in the art.

An LGA power socket interface 140 comprising an array of contact pads 142, 144, 146, etc., existing on one side of the power socket interface 140 function to connect the power socket interface 140 to the DC-DC converter 150. The power socket interface

140 may be part of the socket 130 or, alternatively, may exist as a separate contact arrangement (not shown in this view). The contact pads 142, 144, 146, etc., may be fabricated from metal, conductive polymer, or any other suitable material. The contact pads 142, 144, 146, etc., on the power socket interface 140 correspond to an array of contact pads 152, 154, 156, etc., existing on the DC-DC converter 150. The number and arrangement of the power contact pads 142, 144, 146, 152, 154, 156, etc., is such that the resistance and inductance of the interconnect is minimized. The patterns to minimize inductance are well known to those skilled in the art of the fabrication of microelectronic packages. The two devices may thus be mated together using compression contact technology in the same manner as is previously described. Alignment apertures 162 and 164 on the power socket interface 140 and alignment apertures 166 and 168 on the DC-DC converter 150 help ensure proper alignment between the power socket interface 140 and the DC-DC converter 150 (i.e., when the two devices are compression mounted alignment pins (not shown in this view) are inserted into the alignment apertures 162, 164, 166, and 168 to help align the devices). Although alignment pins are described in the present embodiment, other forms of fastening mechanisms are also possible such as spring clips and the like.

The DC-DC converter 150 connects to a power supply (not shown in this view) that supplies power at a higher voltage (e.g., 12 or 48 volts and ground) than is typically required by the integrated circuit device 110. The DC-DC converter 150 includes conventional voltage conversion circuits within a housing to convert the higher voltage to a lower voltage and to supply the lower voltage to the power socket interface 140 and subsequently to the motherboard in a manner well known in the art. A heat sink

comprised of thermally conductive materials (e.g., copper, aluminum, titanium, etc.) may form the outer casing of the DC-DC converter 150 so that heat generated by the conversion circuits can dissipate by convection directly into the surrounding air in a manner well known in the art. It should be noted that by configuring the DC-DC converter 150 in the manner described by the present embodiment, benefits are provided to the manufacturer in that the DC-DC converter 150 may be separately tested before mating the DC-DC converter 150 to the power socket interface 140.

Referring now to Figure 1B, there is shown a top view of an assembled LGA integrated circuit device package and a DC-DC converter 180 in accordance with an embodiment of the present invention. The array of contacts 152, 154, and 156, etc., on the DC-DC converter 150 and an array of contacts (not shown in this view) on a power socket interface 140 are compression mounted together. Alignment pins (not shown in this view) inserted through alignment apertures 166 and 168 in the DC-DC converter 150 and alignment apertures (not shown in this view) in the power socket interface 140 assist in the proper alignment between the two devices. A retention mechanism 170 performs an additional alignment function and maintains the DC-DC converter 150 in secure electrical contact with the power socket interface 140. The retention mechanism 170 may be fabricated from plastic, aluminum, or any other suitable materials. In the present embodiment, the retention mechanism 170 comprises a frame element rectangular in shape that may be secured with nuts and bolts to the motherboard (not shown in this view), although other fastening techniques well known in the art may also be used. An LGA socket 130 including an LGA package 120 (which includes an integrated circuit device 110) mounted to the socket 130 in a manner well known in the art of

microelectronic fabrication may be mated to the motherboard through a relief (not shown in this view) in the retention mechanism 170. It should be understood, however, that although the retention mechanism 170 is illustrated in the embodiment illustrated by Figure 1B, it is also possible to use the socket 130 itself as a retention mechanism or to  
5 use other similar retention mechanisms known in the art.

Referring now to Figure 2, there is shown an exploded view of a cross section of the contact details of a DC-DC converter mounted to a power socket interface 200 in accordance with an embodiment of the present invention. An array of contacts 210, 220, and 230 on the DC-DC converter 240 are compression mounted to an array of contacts  
10 250, 260, and 270 on the power socket interface 280. The DC-DC converter 240 is pressed downward from a vertical direction on to the power socket interface 280, thus providing for a single direction of assembly.

Referring now to Figure 3, there is shown an exploded view of a cross section of the contact details of an LGA socket mounted to a motherboard 300 in accordance with an embodiment of the present invention. The socket base 310 includes an array of  
15 contacts 312 and 314, etc., formed to receive corresponding land pads of an LGA package (not shown in this view). The contacts 312 and 314, etc., may be formed of a conductive material (e.g., conductive polymer, metal, or others) and extend from a top surface of the socket base 310 to a bottom surface of the socket base 310 and provide  
20 electrical coupling of an integrated circuit device (not shown in this view) to a motherboard 320. Coax structures 322, 324, 326, etc., for high signal integrity may be metalizations of the socket 330 and provide a stop for the socket 330 as it is compressed downward from a vertical direction on to the motherboard 320 so that the contacts 312

and 314, etc., compress to a predetermined level but will not continue to compress further. Copper bar 340 (and multiple other copper bars (not shown in this view)) coupled to the socket base 310 may be used for EMI shielding and/or ground for the integrated circuit device I/O structure. In the embodiment illustrated by Figure 3, the copper bar 340 and the multiple other copper bars are relatively wide and thick (i.e., six ounces), but copper bars of other dimensions may also be used.

Referring now to Figure 4A, there is shown a cross-sectional view of the spatial relationship of the component parts of an unassembled LGA integrated circuit device package and a DC-DC converter 400 in accordance with an embodiment of the present invention. An integrated circuit device 410 may be connected to an LGA package 420 using an array of terminals (i.e., land pads) 422, 424, 426, etc., in a manner described in the embodiment illustrated by Figure 1A. An array of contacts (not shown in this view) on an LGA socket 430 correspond to the land pads 422, 424, 426, etc., on the LGA package 420. The contacts on the socket 430 may be fabricated from conductive polymer or other suitable material and are coupled to the socket base 440. The contacts comprise compressive contacts to receive electrical signals from the integrated circuit device 410 and compressive contacts 432, 434, 436, and 438, etc., to receive power from a DC-DC converter 450.

The DC-DC converter 450 comprises a substrate 452 which may be fabricated of laminates such as FR-4, fiberglass, coated aluminum, or any other suitable material, an output voltage plane (i.e., a VCC voltage plane) 454 to provide output voltage to the socket 430, and a ground plane (GND) 456 to complete the circuit path in a manner well known in the art of power delivery systems. A GND plane 442 may also be included in

the socket base 440. The LGA integrated circuit device package and DC-DC converter may be assembled (not shown in this view) and mounted to a motherboard 460 using conventional fastening techniques in a manner described in the embodiment illustrated by Figure 1A. A LGA power socket interface 470 may be mounted to the DC-DC converter 450 in a manner also previously described in the embodiment illustrated by Figure 1A.

Referring now to Figure 4B, there is shown a cross-sectional view of the spatial relationship of the component parts of an assembled LGA integrated circuit device package and a DC-DC converter 490 in accordance with an embodiment of the present invention. The component parts of Figure 4B are identical to the component parts of Figure 4A and thus retain the same numeric designations.

Thus, a structure and process for delivering high current low voltage DC power from a DC-DC converter to an LGA socket and corresponding microelectronic packages without passing that current through the underlying motherboard has been described. Although the foregoing description and accompanying figures discuss and illustrate specific embodiments, it should be appreciated that the present invention is to be measured only in terms of the claims that follow.

## CLAIMS

1 1. A power delivery system, comprising:  
2 a power converter; and  
3 a land grid array socket mounted to an array of contacts on a surface of the power  
4 converter corresponding to an array of contacts on the land grid array socket.

1 2. The power delivery system of Claim 1 wherein the array of contacts on the power  
2 converter and the array of contacts on the land grid array socket are contact pads  
3 fabricated from electrically conductive material.

1 3. The power delivery system of Claim 1 wherein the land grid array socket is  
2 electrically coupled to a printed circuit board and includes an integrated circuit device  
3 mounted to a land grid array package.

1 4. The power delivery system of Claim 1 wherein the power converter converts  
2 voltage received from a power supply to a lower voltage and transmits the lower voltage  
3 to the land grid array socket.

1 5. The power delivery system of Claim 1 wherein the land grid array socket is  
2 mounted to the power converter and to a printed circuit board using a single direction of  
3 assembly and compression contact technology.

1 6. A power delivery system, comprising:  
2 a power converter;

3 a printed circuit board; and  
4 a land grid array socket mounted to an array of contacts on a surface of the power  
5 converter and on a surface of the printed circuit board using a single direction of  
6 assembly.

1 7. The power delivery system of Claim 6 wherein the array of contacts on the power  
2 converter and on the printed circuit board correspond to an array of contacts on the land  
3 grid array socket, the array of contacts fabricated from electrically conductive material.

1 8. The power delivery system of Claim 6 wherein the land grid array socket includes  
2 an integrated circuit device mounted to a land grid array package.

1 9. The power delivery system of Claim 6 wherein the power converter converts  
2 voltage received from a power supply to a lower voltage and transmits the lower voltage  
3 to the land grid array socket.

1 10. The power delivery system of Claim 6 wherein the land grid array socket is  
2 mounted to the power converter and to the printed circuit board using compression  
3 contact technology.

1 11. A method of mounting a land grid array socket to a power converter, the method  
2 comprising:  
3 providing an array of contacts on a surface of the power converter;

providing an array of contacts on a land grid array socket interface corresponding to the array of contacts on the power converter;

mounting the land grid array socket to the power converter by vertically compressing the array of contacts on the land grid array socket interface with the array of contacts on the surface of the power converter.

12. The method of Claim 11 wherein the step of mounting the land grid array socket to the power converter provides an electrical connection between the land grid array socket and the power converter.

13. The method of Claim 11 wherein the land grid array socket includes an integrated circuit device mounted to a land grid array package.

14. The method of Claim 11 wherein the step of mounting the land grid array socket to the power converter further comprises the step of mounting the land grid array socket to a printed circuit board by vertically compressing an array of contacts on the land grid array socket with an array of corresponding contacts on the printed circuit board.

15. The method of Claim 14 wherein the step of mounting the land grid array socket to the printed circuit board provides an electrical connection between the land grid array socket and the printed circuit board.

16. The method of Claim 11 wherein the step of mounting the land grid array socket to the printed circuit board further comprises the step of mounting the land grid array socket to a retention mechanism, the array of contacts on the land grid array socket

4 mounted to the array of contacts on the printed circuit board through a relief in the  
5 retention mechanism.

1 17. The method of Claim 11 wherein the land grid array socket serves as a retention  
2 mechanism to hold the land grid array socket in proper alignment with the printed circuit  
3 board and in proper alignment with the power converter.

1 18. The method of Claim 11 wherein the power converter converts voltage received  
2 from a power supply to a lower voltage and transmits the lower voltage to the land grid  
3 array socket

## ABSTRACT

A land grid array (LGA) socket is connected to a power converter using compression contact technology eliminating the need for an edge-card connector typically required in such applications. The LGA socket is mounted to the power  
5 converter in a single direction of assembly (i.e., the vertical axis).

**DECLARATION AND POWER OF ATTORNEY FOR PATENT APPLICATION**  
**(FOR INTEL CORPORATION PATENT APPLICATIONS)**

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below, next to my name.

I believe I am the original, first, and sole inventor (if only one name is listed below) or an original, first, and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled

SYSTEM AND METHOD FOR CONNECTING A POWER CONVERTER TO A LAND GRID ARRAY  
SOCKET

the specification of which

X is attached hereto.  
\_\_\_\_\_ was filed on (MM/DD/YYYY) \_\_\_\_\_ as  
United States Application Number \_\_\_\_\_  
or PCT International Application Number \_\_\_\_\_  
and was amended on (MM/DD/YYYY) \_\_\_\_\_  
(if applicable)

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claim(s), as amended by any amendment referred to above. I do not know and do not believe that the claimed invention was ever known or used in the United States of America before my invention thereof, or patented or described in any printed publication in any country before my invention thereof or more than one year prior to this application, that the same was not in public use or on sale in the United States of America more than one year prior to this application, and that the invention has not been patented or made the subject of an inventor's certificate issued before the date of this application in any country foreign to the United States of America on an application filed by me or my legal representatives or assigns more than twelve months (for a utility patent application) or six months (for a design patent application) prior to this application.

I acknowledge the duty to disclose all information known to me to be material to patentability as defined in Title 37, Code of Federal Regulations, Section 1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, Section 119(a)-(d), of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

| <u>Prior Foreign Application(s)</u> |                  |   | <u>Priority Claimed</u> |           |
|-------------------------------------|------------------|---|-------------------------|-----------|
| <u>(Number)</u>                     | <u>(Country)</u> | <u>(Foreign Filing Date - MM/DD/YYYY)</u> | <u>Yes</u>              | <u>No</u> |
| <u>(Number)</u>                     | <u>(Country)</u> | <u>(Foreign Filing Date - MM/DD/YYYY)</u> | <u>Yes</u>              | <u>No</u> |
| <u>(Number)</u>                     | <u>(Country)</u> | <u>(Foreign Filing Date - MM/DD/YYYY)</u> | <u>Yes</u>              | <u>No</u> |

I hereby claim the benefit under Title 35, United States Code, Section 119(e) of any United States provisional application(s) listed below:

|                           |                                   |

No. 31,710, my patent attorney with full power of substitution and revocation, to prosecute this application and to transact all business in the Patent and Trademark Office connected herewith.

## APPENDIX B

### Title 37, Code of Federal Regulations, Section 1.56 Duty to Disclose Information Material to Patentability

(a) A patent by its very nature is affected with a public interest. The public interest is best served, and the most effective patent examination occurs when, at the time an application is being examined, the Office is aware of and evaluates the teachings of all information material to patentability. Each individual associated with the filing and prosecution of a patent application has a duty of candor and good faith in dealing with the Office, which includes a duty to disclose to the Office all information known to that individual to be material to patentability as defined in this section. The duty to disclosure information exists with respect to each pending claim until the claim is cancelled or withdrawn from consideration, or the application becomes abandoned. Information material to the patentability of a claim that is cancelled or withdrawn from consideration need not be submitted if the information is not material to the patentability of any claim remaining under consideration in the application. There is no duty to submit information which is not material to the patentability of any existing claim. The duty to disclose all information known to be material to patentability is deemed to be satisfied if all information known to be material to patentability of any claim issued in a patent was cited by the Office or submitted to the Office in the manner prescribed by §§1.97(b)-(d) and 1.98. However, no patent will be granted on an application in connection with which fraud on the Office was practiced or attempted or the duty of disclosure was violated through bad faith or intentional misconduct. The Office encourages applicants to carefully examine:

- (1) Prior art cited in search reports of a foreign patent office in a counterpart application, and
  - (2) The closest information over which individuals associated with the filing or prosecution of a patent application believe any pending claim patentably defines, to make sure that any material information contained therein is disclosed to the Office.
- (b) Under this section, information is material to patentability when it is not cumulative to information already of record or being made or record in the application, and
- (1) It establishes, by itself or in combination with other information, a prima facie case of unpatentability of a claim; or
  - (2) It refutes, or is inconsistent with, a position the applicant takes in:
    - (i) Opposing an argument of unpatentability relied on by the Office, or
    - (ii) Asserting an argument of patentability.

A prima facie case of unpatentability is established when the information compels a conclusion that a claim is unpatentable under the preponderance of evidence, burden-of-proof standard, giving each term in the claim its broadest reasonable construction consistent with the specification, and before any consideration is given to evidence which may be submitted in an attempt to establish a contrary conclusion of patentability.

(c) Individuals associated with the filing or prosecution of a patent application within the meaning of this section are:

- (1) Each inventor named in the application;
  - (2) Each attorney or agent who prepares or prosecutes the application; and
  - (3) Every other person who is substantively involved in the preparation or prosecution of the application and who is associated with the inventor, with the assignee or with anyone to whom there is an obligation to assign the application.
- (d) Individuals other than the attorney, agent or inventor may comply with this section by disclosing information to the attorney, agent, or inventor.
